From map to geospatial information

Planning is based on knowing the space where the operation takes place. This space is growing, the time available is reduced - geospatial support is transforming, the importance of up-to-date data and database organizing is emphasized. The scope of information to be collected expands and methods evolve; according to NATO terminology, the science of meteorology is also part of geospatial knowledge, thus moving up from the Earth's surface. The possibility of developing geospatial rating and analysis systems for this activity raises many questions and is currently the subject of my research.
