## **Hiding illegal contents on the net: is it possible or even necessary?**

*2019. november 22., péntek 11:50 (20 perc)*

The Darknet is not a commonly used or known part of the Internet. Its existence raises some questions for defenders of IT systems: are their systems protected against attacks from the Darknet? Is protection even necessary? How can they measure the amount of traffic from there? Can they detect whether a darknet server is working in their infrastructure? From another point of view: must illegal contents be published only on the Darknet only or could they published on the surface net on public servers instead? In my presentation I'll point to these questions and show the results of my research.
